

An Automata-Theoretic Approach to Modeling Systems and Specifications over Infinite Data

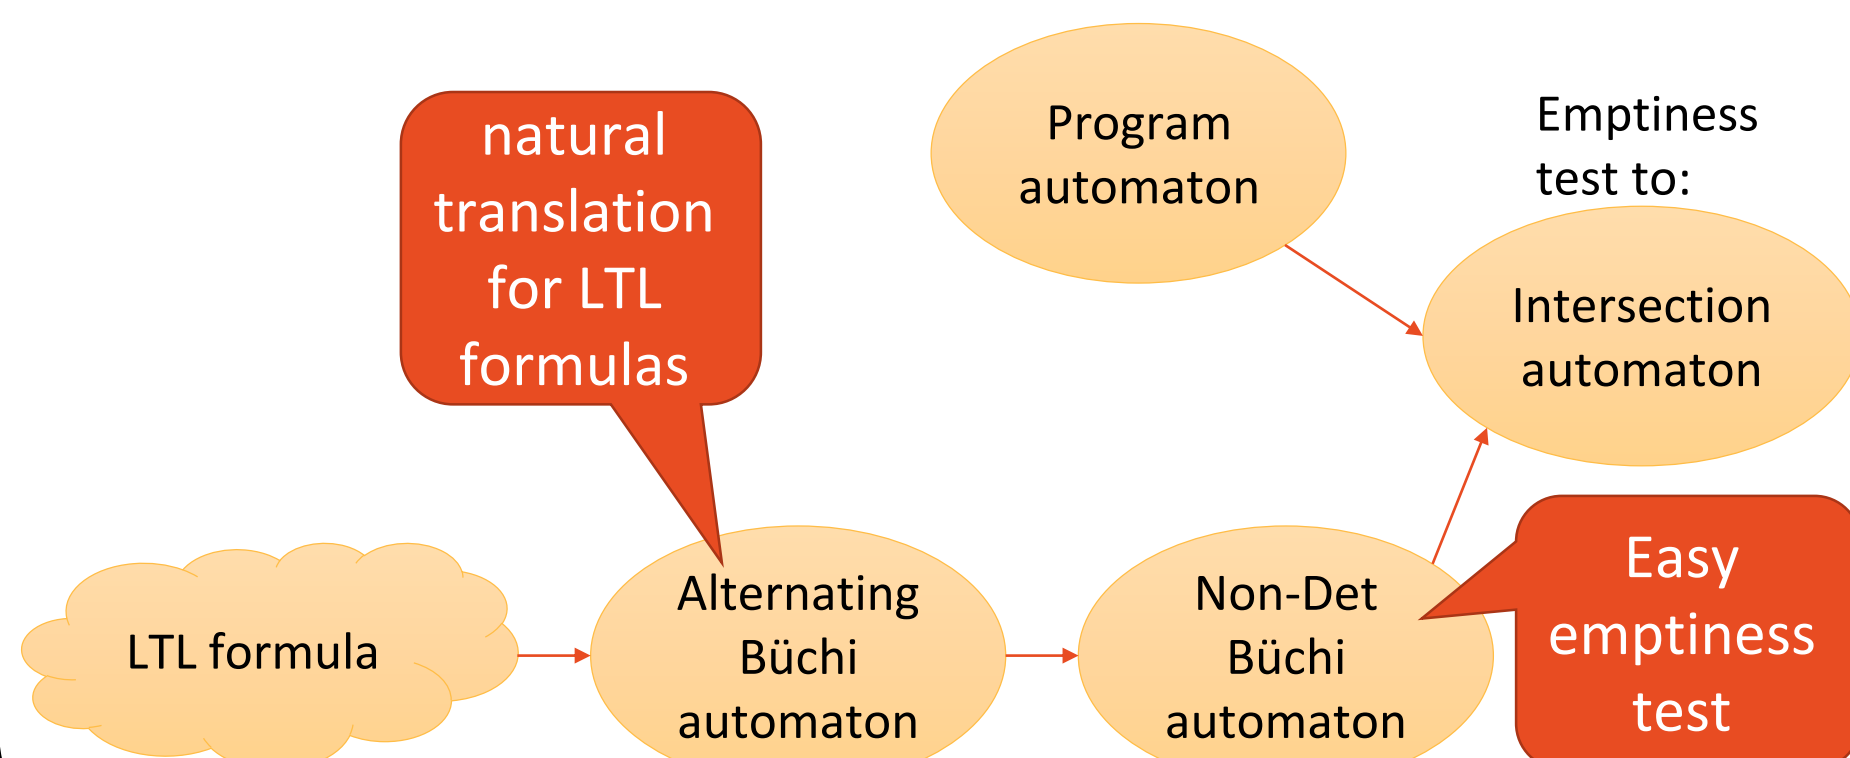

Hadar Frenkel Joint work with Prof. Orna Grumberg and Dr. Sarai Sheinvald (NFM17)
Computer Science Department, Technion- Israel Institute of Technology

Finite data domains

Model checking

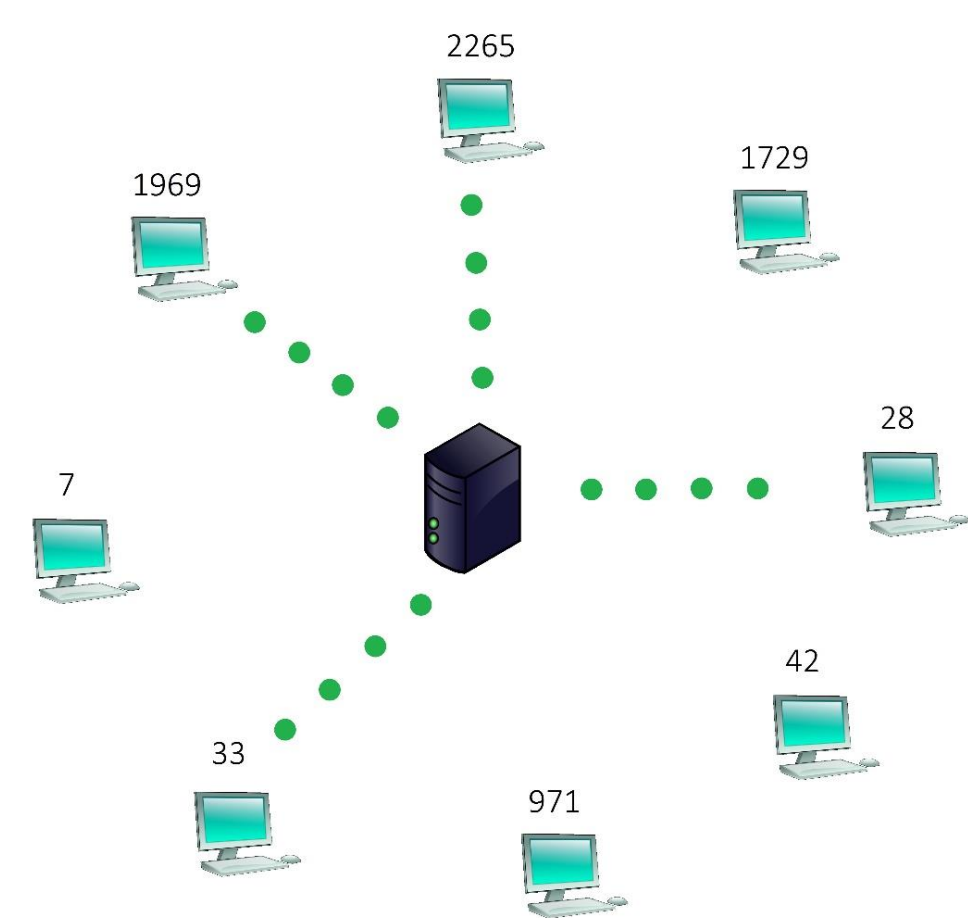

Automata theoretic approach

Infinite data domains

Motivation

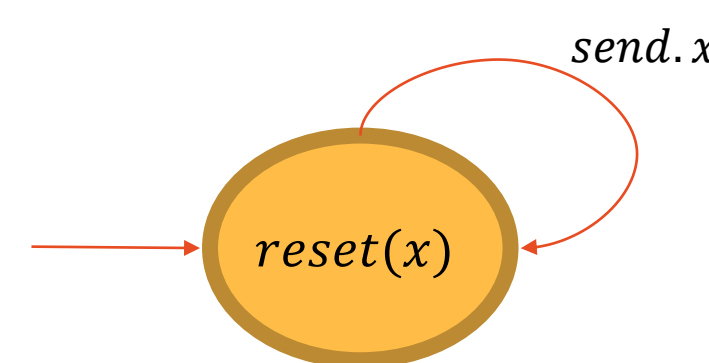

Infinite \ unbounded data domain

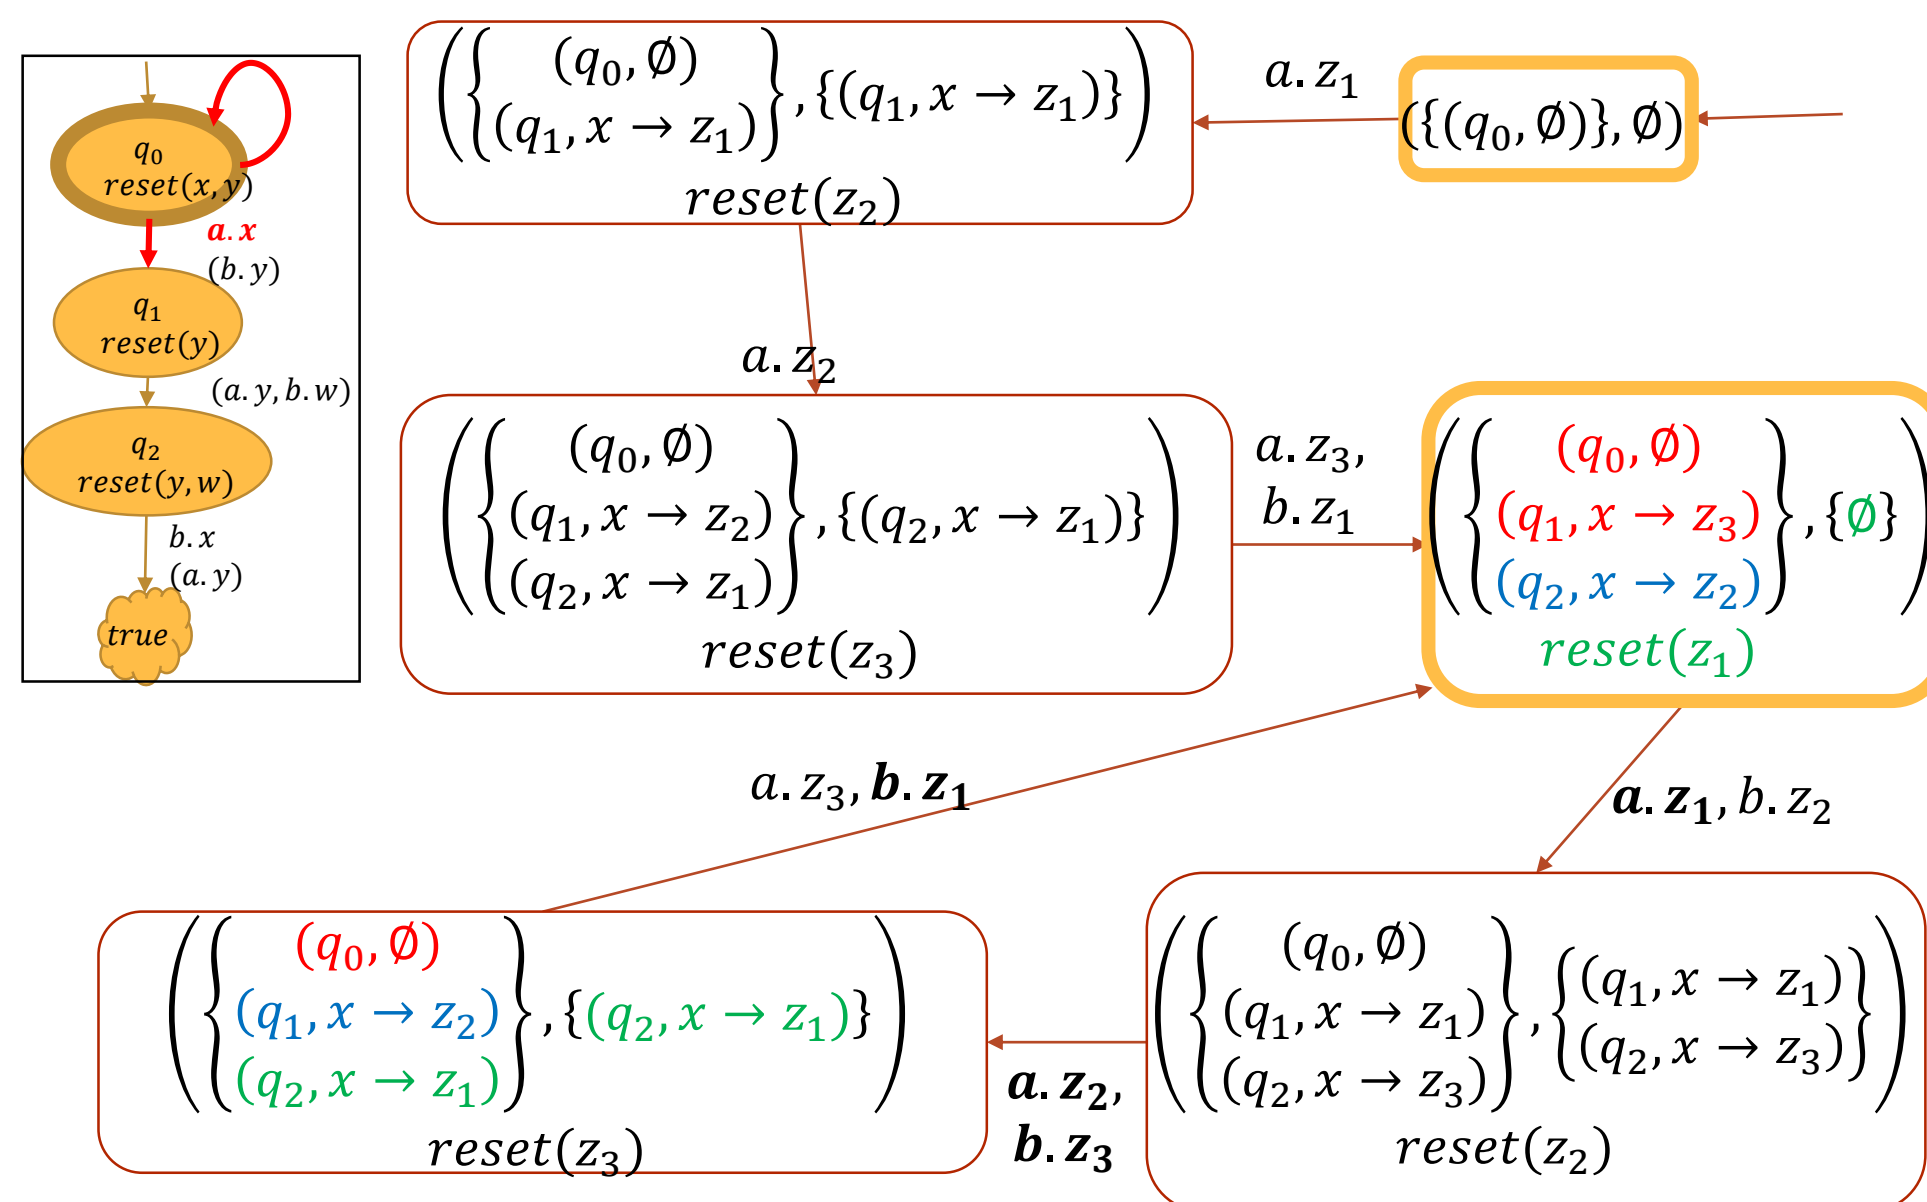

"every client is eventually active"

VLTL & variable Büchi automata

$\forall x F \text{ active}.x$
 $G \exists x: \text{send}.x$

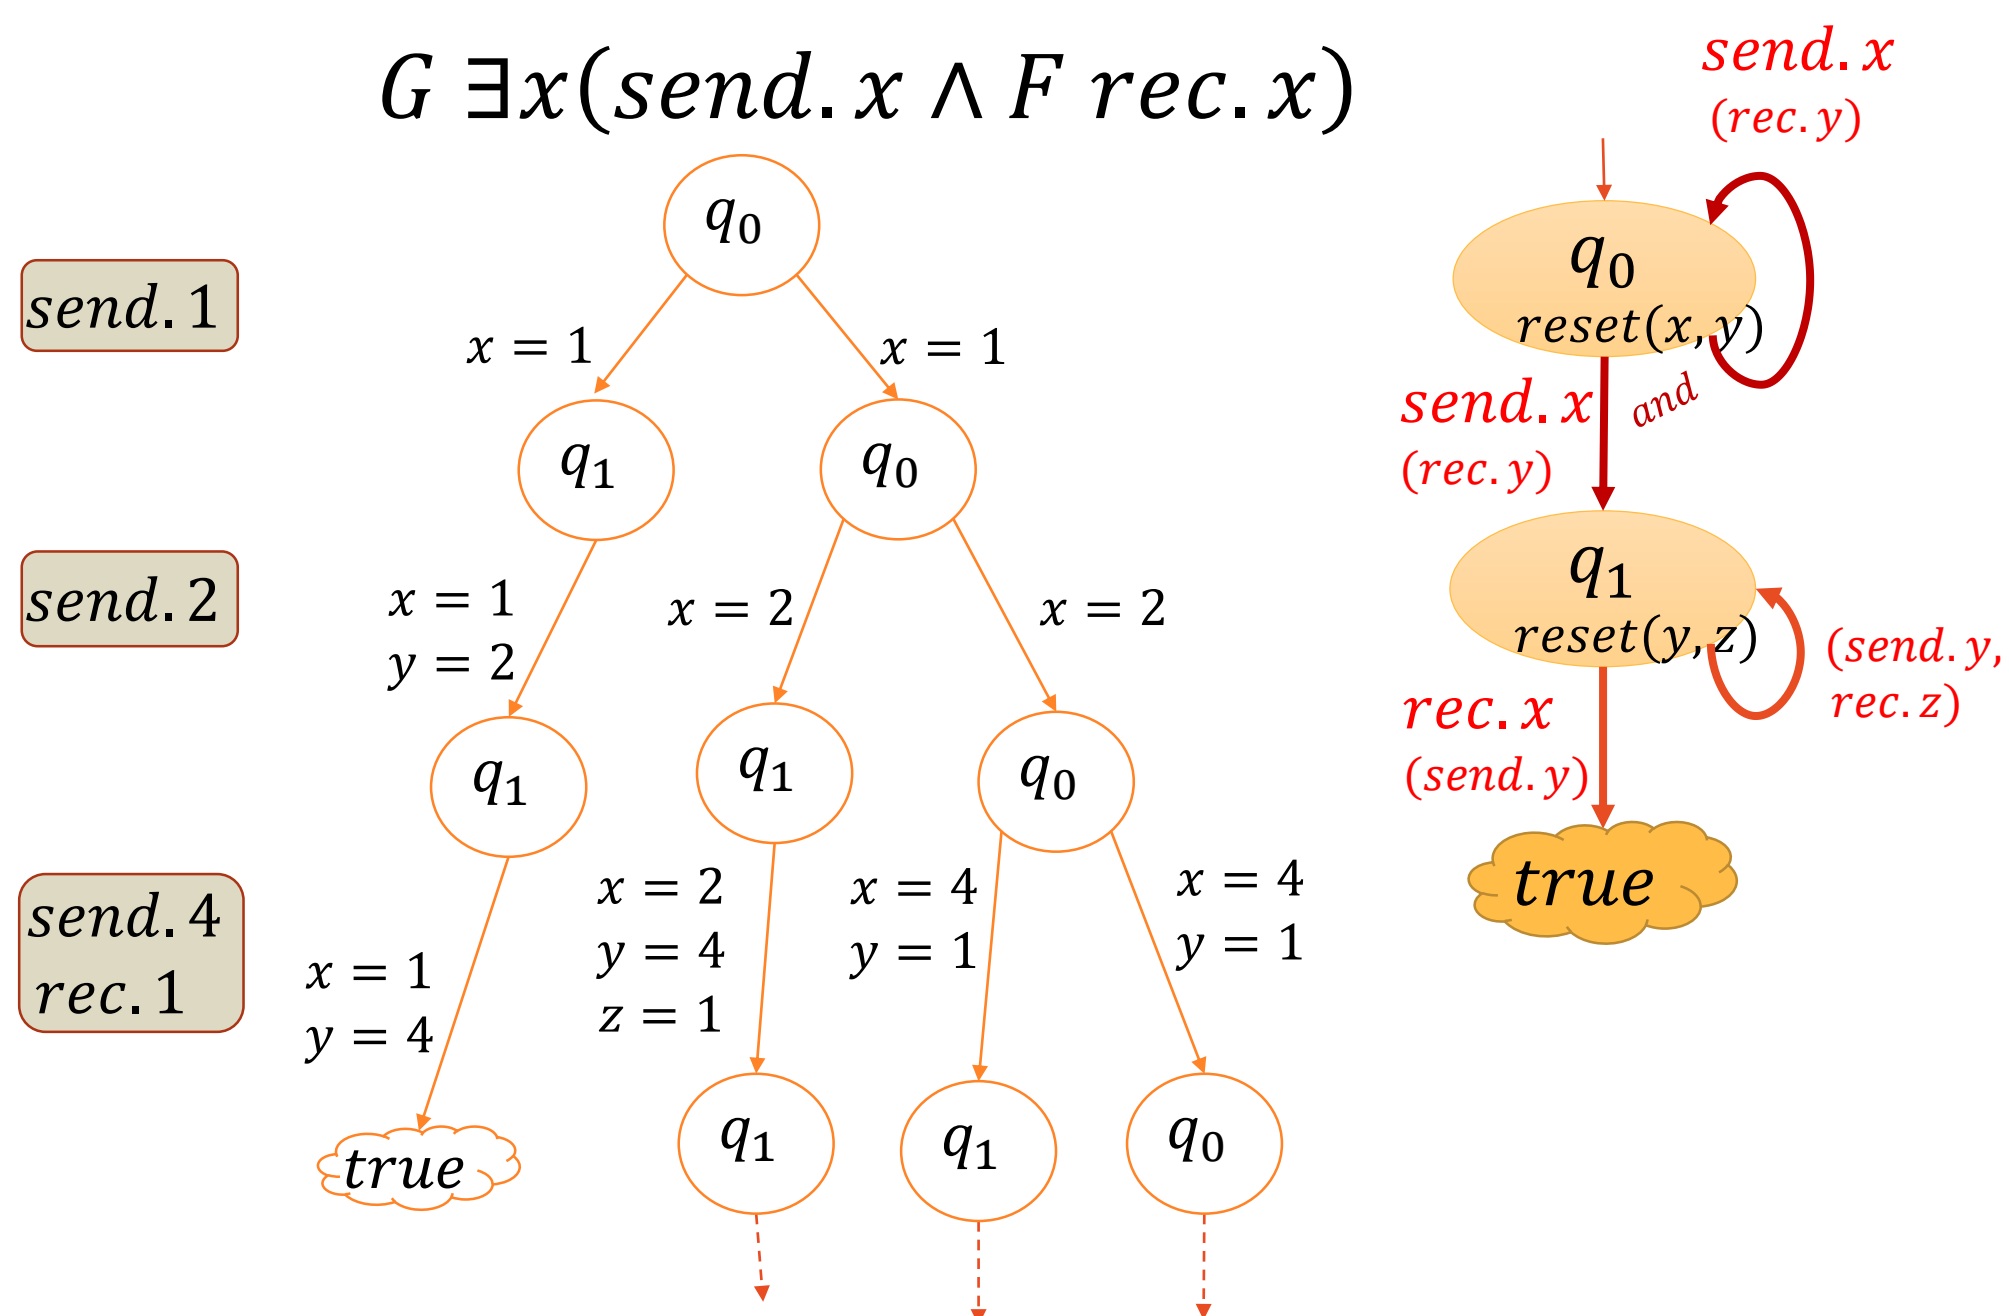

Alternating Variable Automaton \rightarrow Non-Det Variable Automaton

Alternating Variable Büchi Automata

$G \exists x(\text{send}.x \wedge F \text{rec}.x)$

$G \exists x(\text{send}.x \wedge F \text{rec}.x)$

Cannot be expressed In Non-Deterministic Büchi:

- send.1
- send.2
- send.3
- send.4
- send.5
- send.6
- send.7
- send.8
- rec.1
- rec.2
- rec.3
- rec.4

summary
